

**SAFETY INFORMATION SHEET****POST INSTALLATION CAR TOP CONTROL STATION CHECKS**

This Information Sheet is withdrawn.

The requirement in BS EN 81-20 for pit inspection controls and the possibility for multiple inspection stations has resulted in this checklist becoming superseded. The test requirements have become very much more complex than previously for a single inspection control and the test requirements can no longer be provided in a standard check sheet of this type; the conformity assessment is now more complex and needs to be considered by the designer.

The LEIA document has previously been used where car top inspection controls have been added to a lift. The future improvement of a lift is likely to include both the addition of car top and pit inspection control. This is involved than the previous addition of a car top inspection control and requires careful design of the controls.

Members should treat the addition of inspection controls as a modernisation including a careful assessment of the testing and verification requirements.
